- Responsible for developing Freemarker templates for the modules used in the application.
- Developed and reviewed CMS artifacts such as DCR and Page views and Appconfig.
- Implemented Code Review changes using the code-coverage tools such as SONAR, Checkstyle, PMD and delivered code on compliance with BOA standards.

Project: Future State Design - Admin Communications

Client: Bank of America Role- Application Developer
Duration: Oct 2012 - May 2013 Location: Chennai, India

Display of new Look and Feel of Header/Footer and Top-Navigation modules based upon the FSD indicator Cookie, The Top-Navigation is provided with the Account Details information pertaining to the user is displayed on the Accounts tab based upon the FSD eligibility Condition check and is developed using the Java technologies, FTL and TeamSite (CMS).

Responsibilities

- Developed Freemarker templates for the modules used across the web-pages.
- Responsible for managing scope, planning, tracking, change control, aspects of the project.
- Translate customer requirements into formal requirements and design documents, establish specific solutions, and leading the efforts including programming and testing that culminate in client acceptance of the results.

Project: Dotcom- Miscellaneous Pages Migration Online Banking

Client: Bank of America Role: Application Developer
Duration: July 2011 - Sep 2012 Location: Chennai, India

Providing a rich user experience for the clients in navigating across the Bank of America's web pages. This project involved in creating pages for the various line of business like Sitemap, Philanthropy, GWM - HUB pages, Accessible Banking, Help pages and Direct Banking.

URLs:

https://www.bankofamerica.com/accessiblebanking/overview.go
https://www.bankofamerica.com/sitemap/personal.go
https://www.bankofamerica.com/help/overview.go

Responsibilities

- Developed Freemarker templates for the components developed across the pages.
- Responsible for developing contents in XML(DCR) in TeamSite for the Philanthropic pages, which received client appreciation for implementing high-performance design- approaches
- Responsible for effective communication between the offshore project team, onsite team and customer. Provide day to day direction to the project team and regular project status to the customer.

Personal Project: Customizable Paper Keyboard

Developed a standalone Desktop application that simulates a keyboard from a user-defined keyboard layout which is drawn or printed on a piece of paper. The webcam attached to the system detects the user touch on the Paper layout (either printed or drawn) and generates a keystroke event depending on the relative position of the touch on the paper.

Technologies: Visual C#, HTML, CSS, MatLab, jQuery

Features:

- The developed system can be used to design a gaming keyboard of user's choice, placing any number of necessary keys at comfortable positions.
- The application could be modified and could be used to ease the typing for the blind people by placing a Braille printed sheet over the paper layout with the necessary space between the keys.
- The paper Keyboard can be placed over a flat surface which on further improvements can be a replacement for the conventional keyboards for they are lightweight (by which reduces the weight of the laptop), flat typing space similar to that of touch-based Mobile devices like iPad, Tablets, etc.
